

Additions to Insects of New Jersey, No. 3.

By HARRY B. WEISS, New Brunswick, New Jersey.

According to Mr. Buchholz, the *Leucania extincta* Gn. (Lep.) records in the 1909 list, "Insects of New Jersey," refer to *Leucania limita* Gn., which was wrongly identified as *extincta*. Mr. Buchholz further informs me that *Leucania extincta* is a Southern species and has never been taken in New Jersey. This correction was made in my second list (Ent. News, June, 1915, p. 261) without the above explanation. In Dyar's "List of N. A. Lepidoptera," *limita* Gn., *scirpicola* Gn. and *amygdalina* Harvey are given as synonyms of *Heliophila (Leucania) extincta* Gn. *Leucania scirpicola* Gn. is recorded as a distinct species in my second list by Mr. Buchholz. In Smith's "Check List of the Lepidoptera of Boreal America," *extincta* Gn. is listed with *amygdalina* Harv. as a synonym. I would appreciate hearing from interested persons concerning the above confusion and difference of opinion.

Ochria sauzelitae (Lep.) should be cancelled from my first list (Ent. News, March, 1915), as Mr. M. H. Mead informs me that the record was based on a misidentification. *Papaipema necopina* Grt. (Lep.) is mentioned by Smith in his 1909 list as being sure to occur in New Jersey. In my first list of additions it is definitely recorded from Passaic Park by M. H. Mead. In my second list, Mr. Buchholz states that *necopina* has never been taken south of Buffalo, New York, and that *Papaipema maritima* Bird, which he records from Union County, New Jersey, should take the place of *necopina* in the 1909 list which was wrongly identified. In order to clear up the doubt in this matter, it will be necessary for the gentlemen in question to compare their specimens.

To Mr. J. R. de la Torre Bueno, I am indebted for the following notes and corrections relating to the Heteroptera in the 1909 list. *Thyreocoris lateralis* Fab. equals *Thyreocoris gilletteii* V. D. and all records under the latter should apply to the former. *Lygaeus reclinatus* Say is a Western form and not found in New Jersey. *Orsillus scolopax* Say is still un-

recognized. *Cymus clavicularis* Fall. is really *discors* Horn to which all records under the former should be referred. *Heracus plebejus* Stal. is the only species in New Jersey, *orbicollis* Uhl., being a nss. name and undoubtedly referring to the same species. *Reduviolus pallescens* Reut. is a synonym of *R. sordidus* Reut., and all records should be transferred to the latter. *Barce simplicipes* Uhl. is a variety of *annulipes* Stal.

Mr. Torre Bueno also gives the following species which should undoubtedly be found in New Jersey: *Blissus hirtus* Mont. (New York); *Carpilis ferruginca* Stal. (Long Island in cranberry bog); *Leptoglossus magnoliae* Heid. (New York, Long Island, Massachusetts); *Tollius curtulus* Fab. (New York); *Ceraleptus americanus* Stal. (Long Island), (to be found in sandy places probably at roots of beach bushes); *Garzaphia angulata* Heid. (Eastern States); *Carthasis decorata* Uhl.; *Merragata hebroides* B. (Staten Island); *Enicocephalus culicis* Uhl. and *farnicinus* Uhl.; *Milyas barberi* Ds.; *Fitchia spinosula* Stal. (Long Island) and *Phymata vicina* Handl. (New York).
